

## ABSTRACT

## TELECOMMUNICATION SYSTEM WITH CHANNEL SHARING

5           A telecommunication system uses at least one dual mode channel  
capable of supporting variable-rate real-time data (e.g. speech) and  
non-real-time packet data. The packet data is queued in a buffer and  
transmitted when the data rate of the real-time data stream is less than the full  
data capacity of the channel.
